
The *Journal of Investigative Dermatology* has become aware of, and the corresponding author has acknowledged, issues with some figures in this publication. At least one figure (Figure 4b) is inaccurate, and the accuracy of some others cannot be substantiated because corresponding primary data cannot be located. This calls into question the validity of some of the results that have been reported. The Editor has contacted the University of Bordeaux and INSERM and suggested that one or both institutions undertake independent investigations to ascertain the validity of the results reported.
